

- As a note, "displaying the e-mail address via Javascript" doesn't provide much security, but don't worry about it for the project.
 - Intention is to prevent spam bots from picking up the e-mail address
 - Should be reasonable? but unlikely to spend time executing JavaScript
- REST
 - Do all POST requests need to have content returned, even if client doesn't use that content?
 - Are these RESTful routes:
 - `POST: /users/profiles/:username/profile_picture` to set profile picture
 - `GET /users/profiles/:username` to get current user's profile
 - `GET /users/favorites` to get current user's favorite projects
 - `GET /users/myprojects` to get current user's projects
- "You shouldn't return in the middle of an API call, i.e. users.js:49."
 - What is best way to have middleware for some routes but not others?
- Demo
 - How much time?
 - Should spend how long first introducing app motivation/concepts?
- Runtime assertions
 - What is trivial vs non-trivial?
- Consistent layout
 - Many files currently have tabs instead of four spaces, should we switch those?
- Commenting
 - Do we need comments for view files, test files?
 - Example preconditions, for session state?
- Testing
 - We are only unit testing models. Should we test routes (integrated testing)?
