

- Design
 - Any feedback for the data model?
 - Also do the goals for final product have a sufficient level of complexity?
 - Should we have Activity set?
 - Could be Post
 - Could also be upvoting a project, or creating a new project
 - Activity would have a timestamp and is associated with a user
 - Use Activity to generate Activity Feed
- Framework
 - Should we have a separate url for each page?
 - Annoying to refresh with current system
 - Session persistence
 - Should session survive server restarts?
- Front-end
 - How to implement error handling?
 - e.g. we could add a pop-up error dialog whenever an error response is received
 - User profile page - how to show for other users?
 - e.g. we could change “My Projects” to just “Projects” on the current user page, and use that for the general user profile page at /users/{username}
 - or we can have one page to view your own profile, and another that is displayed if you’re viewing profile of some other user
- Other
 - Videos
 - Finalize how to store video media
 - e.g. as a Youtube video ID
 - User enters either Youtube video ID or URL; if URL, then we try to extract the ID, and store as ID in database
 - Rating
 - How to rate projects on trending projects view?
 - e.g. could just segment by day or week, so all projects today are shown first, then yesterday projects, etc.; then rate each time segment by upvotes
 - or could do something that takes into account both age and upvotes
- Workflow
 - Pull requests
 - We said in team contract that we wanted to have code reviews
 - But we haven’t been doing this for starter code
 - Should we start doing this? Or just review after code is committed?
 - Unit testing
 - Are we satisfied with current unit testing strategy?
